

March 9, 2026

The Honorable Shelley Moore Capito
Chair
Subcommittee on Labor, Health and Human
Services, Education, and Related Agencies
U.S. Senate Committee on Appropriations
Washington, DC 20510

The Honorable Robert Aderholt
Chair
Subcommittee on Labor, Health and Human
Services, Education, and Related Agencies
U.S. House Committee on Appropriations
Washington, DC 20515

The Honorable Tammy Baldwin
Ranking Member
Subcommittee on Labor, Health and Human
Services, Education, and Related Agencies
U.S. Senate Committee on Appropriations
Washington, DC 20510

The Honorable Rosa DeLauro
Ranking Member
Subcommittee on Labor, Health and Human
Services, Education, and Related Agencies
U.S. House Committee on Appropriations
Washington, DC 20515

Dear Chairs Capito and Aderholdt and Ranking Members Baldwin and DeLauro,

We, the 66 undersigned organizations representing public health, patients and biomedical researchers request at least \$7.15 billion for the National Institute of Allergy and Infectious Diseases (NIAID) and at least \$51.303 billion for the National Institutes of Health (NIH) overall for fiscal year (FY) 2027, representing an 8.7% increase over FY2026 levels. This funding is critical to ensure that the nation can respond to current and future disease threats.

NIAID has a unique mandate to better understand, treat, and prevent infectious, immunologic, and allergic diseases. The Institute plays an essential role in addressing the impacts of allergy and asthma on human well-being and infectious threats such as pneumonia, norovirus, Lyme disease, tuberculosis, pandemic influenza, and Valley fever. NIAID-funded researchers are working toward eliminating some of the world's most serious health threats, including antimicrobial resistance. NIAID-funded research has fueled some of the biggest public health success stories in recent decades, such as the transformation of HIV/AIDS from a death sentence to a treatable, chronic condition thanks to the development of antiretroviral agents and the development of treatments, vaccines and diagnostics for RSV, tuberculosis, Ebola, type 1 Diabetes, malaria and more. Additionally, NIAID funding is critical to training the public health workforce. Students in NIAID-funded training programs and laboratories go on to work in public health agencies, clinical settings, academic research, and industry.

Thanks to long-term and sustained support from Congress for NIAID over the years, the U.S. has achieved major victories over deadly, disabling, and costly diseases.

These achievements include, but are not limited to:

- Scientists developed new technologies to identify geographic hot spots for Aedes mosquitoes—a type of mosquito that can spread diseases such as dengue, Zika, and chikungunya. The tool is poised to deliver targeted interventions to fight dengue and other diseases in the U.S. and communities across the globe.

- NIAID-funded research has identified treatment that substantially increases the amount of peanut, tree nuts, egg, milk and wheat that multi-food allergic children as young as 1 year could consume without potentially fatal allergic reaction, as research is ongoing in prevention of the development of food allergy in infancy. Currently 8% of children in the U.S. have a food allergy, or 2 in every classroom. NIAID is also sponsoring clinical trials to understand how maternal consumption of peanuts and eggs during pregnancy and breastfeeding prevents babies from developing allergies.
- A clinical trial funded through NIAID found that the monoclonal antibody mepolizumab reduced asthma attacks by more than 25% in children and adolescents with severe asthma. Asthma affects 1 in 13 Americans, including 20 million adults and over 5 million children.
- NIAID-funded research spurred the development of the first vaccine for respiratory syncytial virus (RSV). This treatment will help to prevent an estimated 160,000 hospitalizations and 10,000 deaths of older adults in the U.S. and is projected to save up to \$4 billion in health care costs.
- NIAID researchers discovered a new species of bacteria in the gut that may trigger rheumatoid arthritis (RA), offering new avenues for treatment and prevention. An estimated 50 million Americans suffer from 1 or more autoimmune diseases, including 1.3 million adults with rheumatoid arthritis.
- Each year, drug-resistant infections impact more than 3 million Americans, killing at least 50,000 people in the U.S. NIAID-funded research is essential to combating drug resistance and developing new medicines for drug-resistant infectious threats. It is projected that antimicrobial resistance (AMR) could become the leading cause of death globally by 2050. Currently, treating the six most common antibiotic resistance threats costs the U.S. more than \$4.6 billion annually.

We strongly urge you and your colleagues to work together on FY2027 funding bills and to ensure strong funding for the life-saving work of NIAID so that American ingenuity can continue to forge a healthier, safer and more equitable world for all. Please reach out to Nicole Zimmerman (nzimmerman@asmusa.org) at the American Society for Microbiology if you have any questions.

Sincerely,
